Below is a press release for KIWO's recently released emulsion compatible with all the newest inks, CTS imaging and LED exposure systems on the market today.

KIWO POLYCOL® VERSA-TEX PLUS™

POLYCOL® VERSA-TEX PLUS™ is a **VERSAtile** high solids emulsion specially formulated for use with *all* **TEXTile** inks including traditional plastisol and water-base, phthalate-free and PVC-free plastisol and water-base, as well as high solids, co-solvent and discharge systems.

Its excellent resolution and exposure latitude, high solids and viscosity, quick build-up, and long print run durability provide garment printers optimum stencil thickness with fewer coats, drip-free coating on coarse mesh counts and superior reproduction of fine details using all the newest ink systems.

POLYCOL® VERSA-TEX PLUS™ is extremely **VERSAtile**, as it is not only compatible with all the newest inks, but also the new Computer-to-Screen imaging and LED exposure systems on the market today; and due to its good reclaiming properties, it is ideal for manual or automatic reclaiming.
